DATA STRUCTURE
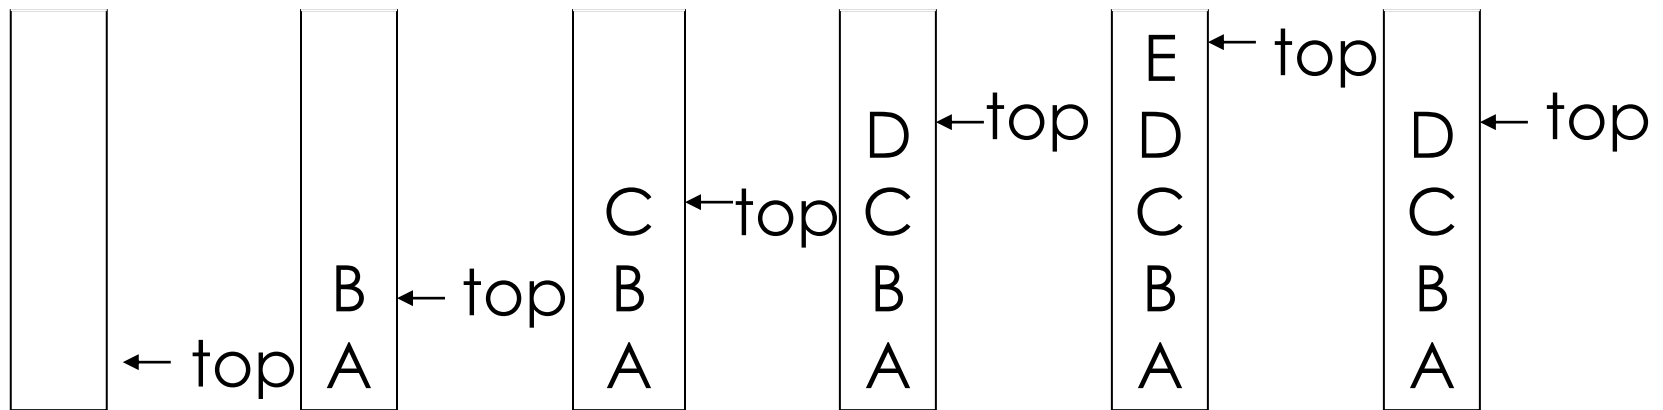

Lecture 04: Stacks and Queues
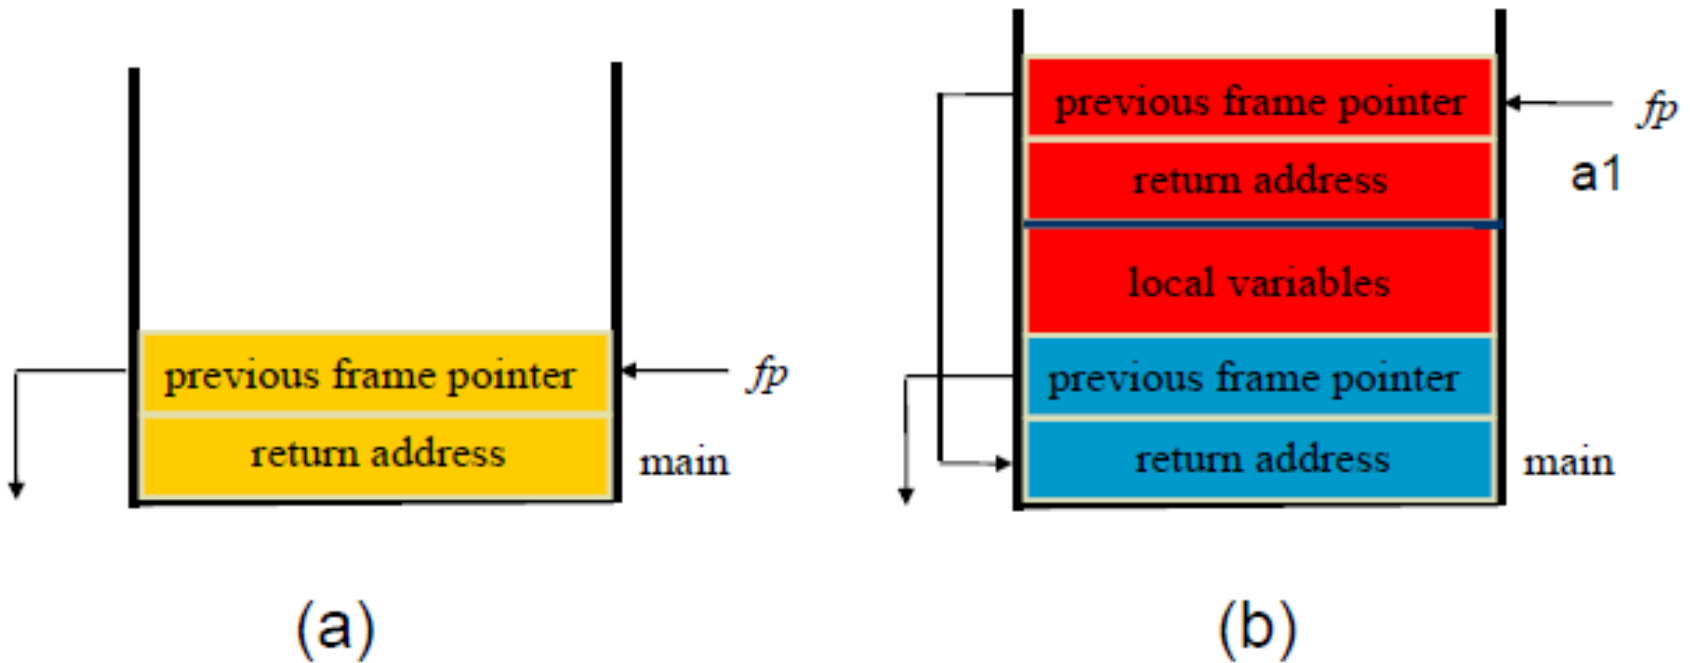

- Push
  - Add an element into a stack
- Pop
  - Get and delete an element from a stack

*Figure 3.1: Inserting and deleting elements in a stack (p.102)

System stack after function call

structure *Stack* is
  objects: a finite ordered list with zero or more elements.
  functions:
   for all *stack* $\in$ *Stack*, *item* $\in$ *element*, *max_stack_size*
   $\in$ positive integer
  Stack CreateS(*max_stack_size*) ::=
          create an empty stack whose maximum size is
          max_stack_size
  Boolean IsFull(*stack*, *max_stack_size*) ::=
          if (number of elements in *stack* == *max_stack_size*)
             return TRUE
          else return FALSE
  Stack Add(*stack*, *item*) ::=
          if (IsFull(*stack*)) *stack_full*
          else insert *item* into top of *stack* and **return**
Boolean IsEmpty(*stack*) ::=
        if(*stack* == CreateS(*max_stack_size*))
          return TRUE
        else return FALSE
Element Delete(*stack*) ::=
        if(IsEmpty(*stack*)) **return**
        else remove and return the *item* on the
          top of the stack.

*Structure 3.1: Abstract data type *Stack* (p.104)

- How to check whether a stack is full or empty?

Stack CreateS(max_stack_size) ::=
#define MAX_STACK_SIZE 100 /* maximum stack size */
typedef struct {
        int key;
        /* other fields */
        } element;
element stack[MAX_STACK_SIZE];
int top = -1;

Boolean IsEmpty(Stack) ::= top< 0;

Boolean IsFull(Stack) ::= top >= MAX_STACK_SIZE-1;

```
void add(int *top, element item)
{
 /* add an item to the global stack */
    if (*top >= MAX_STACK_SIZE-1)  {
        stack_full( );
        return;
    }
    stack[++*top] = item;
}
```

program 3.1: Add to a stack (p.104)

```
element delete(int *top)
{
 /* return the top element from the stack */
    if (*top == -1)
        return stack_empty( );  /* returns and error key */
    return stack[(*top)--];
 }
```
Program 3.2: Delete from a stack (p.105)
- Add an element into a queue
- Get and delete an element from a queue
- Variation
  - Priority queue

*Figure 3.4: Inserting and deleting elements in a queue (p.106)

APPLICATION: JOB SCHEDULING

front	rear	Q[0] Q[1] Q[2] Q[3]	Comments
-1	-1		queue is empty
-1	0	J1	Job 1 is added
-1	1	J1 J2	Job 2 is added
-1	2	J1 J2 J3	Job 3 is added
0	2	J2 J3	Job 1 is deleted
1	2	J3	Job 2 is deleted

*Figure 3.5: Insertion and deletion from a sequential queue (p.108)

structure *Queue* is
  objects: a finite ordered list with zero or more elements.
  functions:
    for all *queue* $\in$ *Queue*, *item* $\in$ *element*,
       max_ queue_ size $\in$ positive integer
    Queue CreateQ(*max_queue_size*) ::=
       create an empty queue whose maximum size is
       max_queue_size
    Boolean IsFullQ(*queue, max_queue_size*) ::=
       if(number of elements in *queue* == *max_queue_size*)
       return *TRUE*
       else return *FALSE*
    Queue AddQ(*queue, item*) ::=
       if (IsFullQ(*queue*)) *queue_full*
      else insert *item* at rear of *queue* and return *queue*

Boolean IsEmptyQ(*queue*) ::=
       if (*queue* ==CreateQ(*max_queue_size*))
      return *TRUE*
      else return *FALSE*
  Element DeleteQ(*queue*) ::=
      if (IsEmptyQ(*queue*)) **return**
      else remove and return the *item* at front of queue.

*Structure 3.2: Abstract data type *Queue (p.107)*

IMPLEMENTATION 1: USING ARRAY

Queue CreateQ(*max_queue_size*) ::=
# define MAX_QUEUE_SIZE 100/* Maximum queue size */
typedef struct {
        int key;
        /* other fields */
        } element;
element queue[MAX_QUEUE_SIZE];
int rear = -1;
int front = -1;
Boolean IsEmpty(queue) ::= front == rear
Boolean IsFullQ(queue) ::= rear == MAX_QUEUE_SIZE-1

```
void addq(int *rear, element item)
{
/* add an item to the queue */
  if (*rear == MAX_QUEUE_SIZE_1) {
    queue_full( );
    return;
  }
  queue [++*rear] = item;
}
```

Program 3.3: Add to a queue (p.108)

DELETING FROM A QUEUE

```
element deleteq(int *front, int rear)
{
/* remove element at the front of the queue */
    if ( *front == rear)
        return queue_empty( );     /* return an error key */
    return queue [++ *front];
}
```

Program 3.4: Delete from a queue(p.108)

problem: there may be available space when IsFullQ is true, i.e.,
             movement is required.

- As the elements enter and leave the queue, the queue gradually shifts to the right.
    - Eventually the rear index equals *MaxSize-1*, suggesting that the queue is full even though the underlying array is not full
- Solution:
    - Use a function to move the entire queue to the left so that *front=-1*
    - It is time-consuming
    - Time complexity=O(MaxSize)

front rear

IMPLEMENTATION 2: REGARD AN ARRAY AS A CIRCULAR QUEUE

- Two indices
    - front: one position counterclockwise from the first element
    - rear: current end
- Problem
    - In order to distinguish whether a circular queue is full or empty, one space is left when queue is full

EMPTY QUEUE

front = 0
rear = 0

front = 0
rear = 3

*Figure 3.6: Empty and nonempty circular queues (p.109)

Problem: one space is left when queue is full
*Figure 3.7: Full circular queues and then we remove the item (p.110)

ADD TO A CIRCULAR QUEUE

```
void addq(int front, int *rear, element item)
{
/* add an item to the queue */
   *rear = (*rear +1) % MAX_QUEUE_SIZE;
    if (front == *rear) /* reset rear and print error */
    return;
  }
    queue[*rear] = item;
}
```

Program 3.5: Add to a circular queue (p.110)

DELETING FROM A CIRCULAR QUEUE

```
element deleteq(int* front, int rear)
{
   element item;
   /* remove front element from the queue and put it in item */
     if (*front == rear)
       return queue_empty( );
               /* queue_empty returns an error key */
    *front = (*front+1) % MAX_QUEUE_SIZE;
    return queue[*front];
}
```

Program 3.6: Delete from a circular queue (p.111)

A MAZING PROBLEM

Program 3.10: Function to get a token from the input string (p.123)

PHASE 1: INFIX TO POSTFIX CONVERSION

- Assumptions:
  - operators: +, -, *, /, %
  - operands: single digit integer

Intuitive Algorithm

(1) Fully parenthesize expression

a / b - c + d * e - a * c

→   ((((a / b) - c) + (d * e)) – (a * c))

(2) All operators replace their corresponding right parentheses.

((((a / b) - c) + (d * e)) - a * c))

/   -   *   *

*   -

(3) Delete all parentheses.

ab/c-de*+ac*-

The orders of operands in infix and postfix are the same.

$a + b * c, * > +$

Token	Stack [0] [1] [2]	Top	Output
a		-1	a
+	+	0	a
b	+	0	ab
*	+ *	1	ab
c	+ *	1	abc
<eos>		-1	abc*+

The orders of operands in infix and postfix are the same.

a * b + c, * > +

Token	Stack [0] [1] [2]	Top	Output
a		-1	a
*	*	0	a
b	*	0	ab
+	+	1	ab*
c	+	1	ab*c
<eos>		-1	ab*c+

$$a *_1 (b + c) *_2 d$$

Token	Stack [0] [1] [2]			Top	Output
a				-1	a
$*_1$	$*_1$			0	a
(	$*_1$	(		1	a
b	$*_1$	(		1	ab
+	$*_1$	(	+	2	ab
c	$*_1$	(	+	2	abc
)	$*_1$	match (		0	abc+
$*_2$	$*_2$	$*_1 = *_2$		0	abc+$*_1$
d	$*_2$			0	abc+$*_1$d
<eos>				-1	abc+$*_1$d$*_2$

- Operators are taken out of the stack as long as their in-stack precedence is numerically less than or equal to the incoming precedence of the new operator, i.e., isp(y)<=icp(x)
- "(" has lowest in-stack precedence (i.e., 8), and highest incoming precedence (i.e.,0).
  - No operator other than the matching right parenthesis ")" should cause it to get unstacked

Priority	Operator
1	Unary minus, !
2	*,/,%
3	+,-
4	<,<=,>=,>
5	==,!=
6	&&
